Fact Sheet

IBOR Fallbacks

With hundreds of trillions of dollars’ worth of contracts referencing LIBOR, which is expected to cease after 2021 and may be followed by the demise of other IBORs, public/private sector working groups globally started identifying alternative risk-free reference rates (‘RFRs’). These RFRs are inherently different from the IBORs. The International Swaps & Derivatives Association, Inc. (‘ISDA’) is implementing prescribed adjustments to the RFRs to serve as IBOR fallbacks based on feedback received from several market consultations regarding these inherent differences. ISDA selected Bloomberg as the official adjustment services vendor in connection with these fallbacks. This factsheet provides an overview of the methodology and implementation of IBOR fallback rate calculations.

“Given the uncertainty about the long-term viability of certain interbank offered rates (IBORs), it is vital that robust fallbacks are included within derivatives contracts. It is also important these fallback rates are independently calculated and widely available across the market. This will dramatically reduce the systemic threat of a permanent discontinuation of LIBOR and other IBORs,” says Scott O’Malia, ISDA’s Chief Executive.

“The publication of robust fallback rates for derivatives referencing key IBORs and the addition of new fallbacks to ISDA’s standard documentation reflects four years of work by ISDA, market participants, regulators and infrastructure providers. This is a major step forward in reducing the risks associated with an IBOR discontinuation, and now work can turn to educating the market on how precisely the fallbacks will function,” says Ann Battle, ISDA’s Head of Benchmark Reform.

“Calculating and distributing IBOR fallbacks fits naturally with Bloomberg Index Services Limited’s (BISL’s) business model. It complements Bloomberg’s capabilities and our ongoing efforts to support investors as they prepare for the transition away from LIBOR,” says Steve Berkley, BISL’s Chief Executive.

“ISDA’s work on updating the fallbacks for key IBORs has been vital in order to smooth the market impact of IBOR cessation. The creation and documentation of robust fallbacks has been complex and we’ve been pleased to work with ISDA, Bloomberg and market participants to help deliver this solution to the market,” says Deepak Sitlani, Partner at Linklaters.
Background

Current Market Gap

- $350tn+ in various financial instruments reference LIBOR, which is expected to cease after the end of 2021 and may be followed by the demise of other IBORs
- Public/private sector working groups globally started identifying alternative RFRs as possible replacements for IBORs (such as SOFR for USD LIBOR)
- Adoption of these alternatives is a significant undertaking, particularly as they are inherently different from the IBORs:
  - These rates lack term structures similar to IBORs (e.g. 1-week, 3-month, etc.)
  - These rates have different behavioral characteristics to IBORs resulting in different historical spreads

Addressing the Market Gap

- ISDA is implementing fallbacks based on the RFRs for LIBOR and the other key IBORs in its standard definitions and has held several market consultations to address these differences in the event the fallbacks are triggered and the fallback rates apply
- ISDA has selected Bloomberg Index Services Limited (‘BISL’) as the official adjustment services vendor to calculate these various IBOR fallbacks

Product Offering

- Calculations to be published are:
  - Adjusted RFR: compounded setting in arrears RFR for each relevant term - daily compounding of publicly available RFRs (e.g. SOFR, SONIA)
  - Spread Adjustment: median of the historical differences between the IBOR for each tenor and the compounded RFR for that tenor over a five-year period prior to an announcement constituting a Trigger Event (as defined below)
  - Fallback Rate: The “all in” fallback rate, which is the combination of the Adjusted RFR and the Spread Adjustment for each relevant tenor
- 11 Fallback Rates are to be published by BISL for each IBOR and Tenor below¹:
  - AUD BBSW 1M, 2M, 3M, 4M, 5M, 6M
  - CAD CDOR 1M, 2M, 3M, 6M, 12M
  - CHF LIBOR S/N, 1W, 1M, 2M, 3M, 6M, 12M
  - EUR EURIBOR 1W, 1M, 3M, 6M, 12M
  - EUR LIBOR O/N, 1W, 1M, 2M, 3M, 6M, 12M
  - GBP LIBOR O/N, 1W, 1M, 2M, 3M, 6M, 12M
  - HKD Hibor O/N, 1W, 2W, 1M, 2M, 3M, 6M, 12M
  - JPY Euroyen TIBOR 1W, 1M, 3M, 6M, 12M
  - JPY LIBOR S/N, 1W, 1M, 2M, 3M, 6M, 12M
  - JPY TIBOR 1W, 1M, 3M, 6M, 12M
  - USD LIBOR O/N, 1W, 1M, 2M, 3M, 6M, 12M

¹ Given different time zones of the underlying data, Fallback Rates are published periodically throughout the day.

‘IBOR’ and ‘Tenor’ are defined in the IBOR Fallback Rate Adjustments Rule Book.
Overview of IBOR Fallbacks Methodology and 2006 ISDA Definitions

Below is an overview of key terms associated with the IBOR fallbacks methodology and the 2006 ISDA Definitions.

| Adjusted RFR$^3$ | To determine the Adjusted RFR, the underlying RFR is compounded over an accrual period corresponding to the tenor of the IBOR. The start of the accrual period is determined firstly by following the market convention Reference Spot Lag, and then applying a two business day backward shift, or Offset Lag. The compounded rate is annualized, and the day count convention adjusted to match that of the IBOR. |
| Spread Adjustment$^3$ | If the Original IBOR Rate Record Day (defined below under ‘Fallback Rate’) is prior to the Spread Adjustment Fixing Date (defined below), the Spread Adjustment is the median spread between the IBOR and the Adjusted RFR over the preceding five-year period (from the Median Period Start Date to the Median Period End Date, as each is defined below). The Spread Adjustment is fixed effective the Spread Adjustment Fixing Date (for a given IBOR and Tenor), which is the earlier of: (i) the IBOR Cessation Trigger Date (or ‘Index Cessation Event’ under the updated 2006 ISDA Definitions) for all Tenors of the relevant IBOR; and (ii) the first date on or after the Tenor Cessation Trigger Date for a particular Tenor of the relevant IBOR for which there has been an announcement of cessation (or, in the case of LIBOR, non-representativeness) for all shorter Tenors and/or all longer Tenors. |
| Fallback Rate | The Fallback Rates each correspond to an ‘Original IBOR Rate Record Day’, which is the date that the relevant IBOR would have appeared on the screen. For certain IBORs (e.g. GBP LIBOR), this is the Reset Date under the 2006 ISDA Definitions, while for other IBORs (e.g. USD LIBOR), it is two banking days prior to such Reset Date. Note that, for the purpose of calculating a continuous data series, Fallback Rates are also published for ‘Original IBOR Rate Record Days’ that are non-business day weekdays, even though those dates would not have had IBOR rates published. Fallback Rate = Adjusted Reference Rate + Spread Adjustment. |
| 2006 ISDA Definitions$^4$ | On or after the Index Cessation Effective Date under the updated 2006 ISDA Definitions, one needs to look up the Fallback Rate for a given IBOR and Tenor that corresponds to the Original IBOR Rate Record Day. One looks up this Fallback Rate two payment business days prior to the Payment Date for the relevant transaction (the ‘Fallback Observation Date’). If the Fallback Rate for the Original IBOR Rate Record Day is available by the cut off time on the Fallback Observation Date, one should use that. If it is not available, one should use the Fallback Rate that has been published for the most recent Original IBOR Rate Record Day (as at the cut off time on the Fallback Observation Date). |

Figure 1
Interplay of the key dates associated with the IBOR Fallbacks Rule Book and 2006 ISDA Definitions

1 Please refer to the IBOR Fallback Rate Adjustments Rule Book and the 2006 ISDA Definitions for additional details.
2 Capitalized terms used in this row and not otherwise defined in this document have the meaning given to them in the IBOR Fallback Rate Adjustments Rule Book.
3 Capitalized terms used in this row and not otherwise defined in this document have the meaning given to them in the 2006 ISDA Definitions.
4 Please note that as of the Spread Adjustment Fixing Date, this is fixed and will not change. Therefore, the period between the time period for calculating the Spread Adjustment and the time period for calculating the Adjusted RFR will continuously lengthen. Please also note that Figure 1 assumes that the Spread Adjustment Fixing Date has not yet occurred or occurs on the same day as the Original IBOR Rate Record Day.
Publication Schedule

The determination of dates used in the calculation is based on the relevant calendars and exchange schedules. The dates for which Fallback Rates will or will not be published are set out in the **IBOR Fallback Rate Adjustments Rule Book** (the 'Rule Book'), which is available on ISDA <GO> on the Bloomberg Terminal® and Bloomberg's LIBOR Transition website, as well as ISDA's Benchmark Reform and Transition from LIBOR page.

Interpolation Associated with the Spread Adjustment

If the publication of one or more Tenors of an IBOR is discontinued, or, in the case of LIBOR, if such Tenors become non-representative, prior to the complete cessation( or, in the case of LIBOR, non-representativeness) of the IBOR, then the Spread Adjustment will continue to be calculated for the Tenors that continue to be published (and, in the case of LIBOR, are not non-representative) and those Tenors where at least one shorter and at least one longer Tenor are still available (and, in the case of LIBOR, not non-representative). In these latter cases, the values for the discontinued (or, in the case of LIBOR, non-representative) Tenor in the spread calculation shall be determined using linear interpolation between the closest shorter and closest longer available Tenors (which, in the case of LIBOR, are not non-representative). Upon a Spread Adjustment Fixing Date for the Tenor that had been discontinued (or, in the case of LIBOR, was non-representative), the calculation of the Spread Adjustment will include as data points the interpolated IBOR rates that were calculated during the relevant portion of the historical period.

As discussed in the ‘Discontinued Rates Maturities Provisions’ section below, these interpolation mechanisms are consistent with the interpolation that will apply contractually if certain but not all Tenors of an IBOR are discontinued (or, in the case of LIBOR, become non-representative) prior to the cessation (or, in the case of LIBOR, non-representativeness) of the IBOR.

Additional details associated with the calculation of the Fallback Rates can be found in the Rule Book. For further understanding, a Sample Calculation is provided in Appendix 1.

Trigger Events for Fallback Rates

The fallbacks in the 2006 ISDA Definitions will be triggered upon the following Trigger Events (which are called ‘Index Cessation Events’ in the 2006 ISDA Definitions):

- A public statement or publication of information by or on behalf of the administrator of the Applicable Rate announcing that it has ceased or will cease to provide the Applicable Rate permanently or indefinitely, provided that, at the time of the statement or publication, there is no successor administrator that will continue to provide the Applicable Rate;

- A public statement or publication of information by the regulatory supervisor for the administrator of the Applicable Rate, the central bank for the currency of the Applicable Rate, an insolvency official with jurisdiction over the administrator for the Applicable Rate, a resolution authority with jurisdiction over the administrator for the Applicable Rate or a court or an entity with similar insolvency or resolution authority over the administrator for the Applicable Rate, which states that the administrator of the Applicable Rate has ceased or will cease to provide the Applicable Rate permanently or indefinitely, provided that, at the time of the statement or publication, there is no successor administrator that will continue to provide the Applicable Rate; or

- If the Applicable Rate is Sterling LIBOR, Swiss Franc LIBOR, U.S. Dollar LIBOR, Euro LIBOR or Yen LIBOR only, a public statement or publication of information by the regulatory supervisor for the administrator of such Applicable Rate announcing that (A) the regulatory supervisor has
determined that such Applicable Rate is no longer, or as of a specified future date will no longer be, representative of the underlying market and economic reality that such Applicable Rate is intended to measure and that representativeness will not be restored and (B) it is being made in the awareness that the statement or publication will engage certain contractual triggers for fallbacks activated by pre-cessation announcements by such supervisor (howsoever described) in contracts.

The first two bullet points above relate to permanent cessation, and the third bullet point above is the ‘pre-cessation’ trigger.

These Trigger Events are relevant to the calculation of the Spread Adjustment, as described above, because these Trigger Events determine the Spread Adjustment Fixing Date. However, importantly, in connection with the permanent cessation fallbacks or pre-cessation fallbacks (in the case of LIBOR), the Fallback Rates will not apply until the actual cessation of the relevant IBOR (or the cessation of the relevant Tenor and all shorter or all longer Tenors) or actual non-representativeness of LIBOR (or the non-representativeness (in the case of LIBOR) of the relevant Tenor and all shorter or all longer Tenors).

**Update to 2006 ISDA Definitions for ‘Rate Options’**

ISDA is amending various ‘rate options’ in the 2006 ISDA Definitions for the IBOR benchmarks listed above to provide that the Fallback Rates will apply upon the permanent discontinuation of those IBORs and, in the case of LIBOR, if LIBOR becomes ‘non-representative’. As it has done from time to time, ISDA will amend the 2006 ISDA Definitions by publishing a ‘Supplement’ to the 2006 ISDA Definitions. Upon publication of this Supplement, transactions incorporating the 2006 ISDA Definitions that are entered into on or after the date of the Supplement (i.e. the date on which the 2006 ISDA Definitions are amended) will include the amended rate option (i.e. the rate option with the provisions contemplating the application of the relevant Fallback Rate).

Transactions entered into prior to the date of the Supplement (so called ‘legacy derivative contracts’) will continue to be based on the 2006 ISDA Definitions as they applied to the legacy derivative contracts before they were amended pursuant to the Supplement, and therefore will not include the amended rate option with references to the relevant Fallback Rate and related triggers.

ISDA therefore also expects to publish a protocol to facilitate the update of rate options in legacy derivative contracts so as to include references to the relevant Fallback Rate and related triggers. By adhering to the protocol, market participants are agreeing that their legacy derivative contracts with other adherents will include the amended rate option for the relevant IBOR (or equivalent terms) and will therefore include the references to the relevant Fallback Rate and related triggers. Given that the relevant IBORs are included in a broad range of derivative as well as non-derivative agreements, the protocol goes beyond merely amending legacy derivative contracts that incorporate the 2006 ISDA Definitions. For example, it covers legacy derivative contracts that incorporate previous iterations of interest rate definitional booklets published by ISDA as well as agreements such as the Global Master Repurchase Agreement.

As always, adherence to the protocol will be completely voluntary and will amend contracts only between two adhering parties (i.e. it will not amend contracts between an adhering party and a non-adhering party or between two non-adhering parties). Counterparties could alternatively agree to include the amended rate options via a bilateral amendment agreement.

---

6 ISDA is also amending certain rate options that use USD LIBOR as an input to include fallbacks that would apply if USD LIBOR is permanently discontinued or is non-representative.
Terms of the Amended Rate Options

In the Supplement to the 2006 ISDA Definitions, the Trigger Events are the same as those referenced above but they are called Index Cessation Events. After an announcement constituting an Index Cessation Event is made, the fallback will apply from the related Index Cessation Effective Date. This is the date on which the IBOR is permanently discontinued or, in the case of LIBOR, is non-representative. During the period between the Index Cessation Event and the Index Cessation Effective Date (if any), the relevant document will continue to reference the relevant IBOR. Whether any such period exists, and the length of the period, is based on the information in the announcement constituting the Index Cessation Event and therefore will not be known until the time of the Index Cessation Event.

See the diagram below for further information regarding when the fallbacks are calculated and when the fallbacks apply in the case of a permanent cessation or pre-cessation (in the case of LIBOR) Index Cessation Event and Index Cessation Effective Date.

The Fallback Rate will be the Fallback Rate for the relevant IBOR and Tenor that corresponds to the Original IBOR Rate Record Day, provided that this Fallback Rate appears on the relevant screen at least two Business Days (as defined in the 2006 ISDA Definitions as applicable for the purposes of payment) prior to the relevant Payment Date. The Payment Date will be specified in the contract and will typically be at the end of the relevant Calculation Period (as defined in the 2006 ISDA Definitions). Parties can define the relevant Business Days in the contract so as to ensure that the Fallback Rate will be known two days in advance of the payment being due based on the Business Day calendar in relevant jurisdictions. If the parties do not specify places for the purposes of the reference to Business Days for payment purposes within the contract, then the 2006 ISDA Definitions will implement default Business Day calendars (e.g. London for GBP LIBOR). This means that two transactions which referenced the same IBOR on the same day may apply a different Fallback Rate if different Business Day calendars apply to those transactions.

As mentioned above, each Fallback Rate that is published will be linked to an Original IBOR Rate Record Day. This is the date that the relevant IBOR would have appeared on the screen. For example, in the context of GBP LIBOR this is the Reset Date under the 2006 ISDA Definitions and in the context of USD LIBOR this is two banking days prior to the Reset Date. Note that, for the purpose of calculating a continuous data series, Fallback Rates are also published for ‘Original IBOR Rate Record Days’ that are non-business day weekdays, even though those dates would not have had IBOR rates published.

---

7 If, for each transaction, the Fallback Rate for the Original IBOR Rate Record Day is on the screen two Business Days prior to the Payment Date, the same Fallback Rate would be used in each of those transactions. However, if different Business Day calendars mean that this Fallback Rate is not on the screen by that day for one of those transactions, the two transactions may apply different Fallback Rates.
If, however, the Fallback Rate for the Original IBOR Rate Record Day corresponding to the Reset Date (or the day two banking days prior to the Reset Date, as applicable) is not produced by Bloomberg two Business Days prior to the Payment Date, then the Fallback Rate that has been published for the most recent Original IBOR Rate Record Day should be used. This will have the effect of applying a dynamic ‘backward shift’ (i.e. the standard two-day backward shift that applies under the Bloomberg Rule Book for the Fallback Rates will effectively be lengthened in this scenario to the number of days necessary for the Fallback Rate to be known two Business Days prior to the ‘Payment Date’).

The Supplement to the 2006 ISDA Definitions also includes provisions dealing with a permanent discontinuation of the Fallback Rates and the RFRs themselves. In this scenario, additional fallbacks are specified which are currency-specific. For example, for GBP LIBOR, there is a further fallback based on the Bank of England’s bank rate and, for USD LIBOR, there are further fallbacks based on any rate recommended by the Federal Reserve, the Overnight Bank Funding Rate and the FOMC Target Rate.

Discontinued Rates Maturities Provisions

Alongside restating various rate options, the Supplement to the 2006 ISDA Definitions includes a new mechanism to determine a rate if a specific Tenor is discontinued (or, in the case of LIBOR, is ‘non-representative’) and the provider of that rate continues to publish at least one shorter Tenor and at least one longer Tenor (and, in the case of LIBOR, these Tenors are not ‘non-representative’). In this scenario, the relevant rate would be determined by interpolating the nearest remaining shorter rate and the nearest remaining longer rate (assuming, only in the case of LIBOR, that those rates are not ‘non-representative’).

Fallbacks for Calculation Periods to which ‘Linear Interpolation’ applies and Calculation Periods which apply a rate with a tenor that is longer than the period

Fallbacks to which ‘Linear Interpolation’ applies:

The Supplement to the 2006 ISDA Definitions also specifically deals with Calculation Periods to which Linear Interpolation (as such terms are defined in the 2006 ISDA Definitions) is specified to apply. In these cases, the rate for a non-standard period is calculated by reference to two rates with standard Tenors, one of which will often have a Tenor that is longer than the length of the Calculation Period.

If the Fallback Rates apply, however, the Adjusted RFR for the longer Tenor will not be known until the end of that longer Tenor period and so the ‘standard’ Fallback Rate may not be appropriate in this scenario.

The Supplement to the 2006 ISDA Definitions therefore provides that if Linear Interpolation cannot be used as originally anticipated (for example, if specific Tenors which were to be used have been discontinued) then:

- interpolation of remaining IBOR Tenors (which, in the case of LIBOR, are not ‘non-representative’) pursuant to the discontinued rates maturities provisions will apply (the discontinued rates maturities provisions apply where an interpolated rate was not originally used but also where a Tenor that was previously used for interpolation has been discontinued or is non-representative in the case of LIBOR); and

- if the only remaining IBOR Tenors (which, in the case of LIBOR, are not ‘non-representative’) are all shorter or all longer than the Calculation Period, then the Calculation Agent will determine the applicable fallback rate by compounding the RFR over the length of the Calculation Period (backward-shifted by two Business Days) and adding a spread. If the Bloomberg spread for longer and shorter tenors has been fixed (i.e. if the ‘Spread Adjustment Fixing Date’ has occurred for such tenors) then the fixed spread for the nearest shorter and nearest longer tenor will be interpolated.
If the Bloomberg spread has been fixed only for shorter tenors or only for longer tenors, then the fixed spread for the nearest shorter or nearest longer tenor shall be added.

Calculation Periods which apply a rate with a tenor that is longer than the period:

The ‘standard’ fallbacks will be used for a Calculation Period to which Linear Interpolation is not specified to apply. This means that if (i) an IBOR with a tenor that is longer than the length of the Calculation Period is ordinarily used, (ii) that IBOR tenor is discontinued (or, in the case of LIBOR, is non-representative), (iii) the discontinued rates maturities provisions cannot be applied because there are no other IBOR Tenors remaining (which, in the case of LIBOR, are not ‘non-representative’) or there are only longer or only shorter IBOR Tenors remaining (which, in the case of LIBOR, are not ‘non-representative’), then the parties will use the Fallback Rate on the screen two payment Business Days prior to the Payment Date notwithstanding that this Fallback Rate relates to an earlier Original IBOR Rate Record Day.

Accessing Data

Bloomberg will make the Adjusted RFRs, the Spread Adjustments and the Fallback Rates broadly available to industry participants through:

| Bloomberg Terminal, Data License | The data will be available to Bloomberg customers through various distribution channels such as the Bloomberg Terminal, the Desktop API and Data License. The latest available data will be displayed at <FBAK><GO>. Data for prior days will be displayed at <HP><GO>. Separate to this data, Bloomberg Terminal customers already have access to RFRs and compounded RFRs data at <EONC> <GO>. Further information about this, and LIBOR transition more widely, is available at <RFR> <GO>. Please see Appendix 2 for a list of tickers associated with the Adjusted RFRs, the Spread Adjustments and the Fallback Rates. |
| Authorized Redistributors | The data will be available through authorized redistributors. |
| Bloomberg website | Delayed data will be publicly available on Bloomberg’s website. |

Licensing

A License is required from Bloomberg for the re-distribution or usage of the Adjusted RFRs, the Spread Adjustments and the Fallback Rates. Specifically, use of the fallback rates within ISDA contracts, including swaps and interest rate options, whether cleared or uncleared, will require a usage license. The license also provides for use of Bloomberg’s data outside the scope of an ISDA contract, for example, as a fallback in cash instruments such as loans, FRNs and mortgages.

Overview

- Three license types are available
  - Re-distribution License
  - Infrastructure Provider Usage License
  - Firm-wide Usage License
- A Usage License permits firm-wide enterprise usage for multiple purposes. This is a group-wide global license and includes affiliates. There is no ‘per user’ count and no ‘product’ count
• Annual Redistribution License fees and Usage License fees for infrastructure providers (e.g. CCPs, exchanges, benchmark administrators, index services providers, enterprise analytics providers, etc.) apply from the date of subscription

• Annual Usage License fees are waived for all other firms until the earlier of 2022 and the ‘Index Cessation Effective Date’ for an IBOR in accordance with the terms of the updated 2006 ISDA Definitions

Additional Details

• Excluding infrastructure providers, Usage License fee waivers continue to apply for smaller institutions with assets below USD5bn, who subscribe to use a single rate set (a rate set includes all tenors for a rate)

• Payable from date of subscription
  o Vendor Re-distribution License
    • Realtime & Delayed data: $50,000
    • Delayed data (24hr): $10,000
  o Infrastructure Provider Usage License:
    (applicable for CCPs, exchanges, ‘for-profit’ benchmark administrators, index services providers and enterprise analytics providers)
    • Single rate set: $50,000
    • Two or more rate sets: $100,000

• Payable from the effective date of IBOR fallbacks8
  o Infrastructure Provider Usage License:
    (applicable for government agency / ‘not-for-profit’ benchmark administrators, for use in benchmarks and derived benchmarks)
    • Single rate set: $50,000
    • Two or more rate sets: $100,000
  o Firm-wide Usage License:
    • Single rate set: $5,0009
    • Two or more rate sets:
      - Financial Institution: $20,000
      - Non-financial Institution: $10,000

Note on Usage

• BISL is authorised and regulated by the Financial Conduct Authority. However, users should note that the IBOR transition is to RFRs produced by central banks. The adjustment calculations described in this fact sheet aim to facilitate this transition and the adoption of these RFRs but the IBOR Fallbacks are not themselves separate benchmarks for purposes of the EU benchmark regulation (including similar applicable frameworks, ‘BMR’).

• Users should be aware that prior to the Spread Adjustment becoming fixed upon the Spread Adjustment Fixing Date, neither the Spread Adjustment nor IBOR Fallback should be used as a primary reference rate within a financial instrument or financial contract (or other ‘use’ as defined in the BMR) other than as a contractual fallback. Use of Bloomberg’s calculations to the contrary is expressly prohibited.

Further details available in FAQs on ISDA <GO> or www.bloomberg.com/professional/solution/libor-transition. Bloomberg reserves the right to amend these commercial terms.

---

8 If LIBOR and/or other IBORs continue beyond the end of 2021 and the Index Cessation Effective Date for one or more fallbacks has not occurred, Bloomberg reserves the right to apply Usage License fees.

9 Usage License fees are waived for institutions using a single rate set and with assets below $5bn. The waiver does not apply to infrastructure providers, including benchmark administrators.
Appendix 1: Sample Calculation of IBOR Fallbacks

Step 1: Determine the Accrual Start Date
- Let 16-Oct-2019 be the date for which a fallback for 3M USD LIBOR rate needs to be determined. This is the Rate Record Day.
- Find the Accrual Spot Date by adding the spot lag for USD LIBOR which is two Business Days. This gives 18-Oct-2019, which is the Reset Date.
- Subtract the Offset Lag (two Business Days) from the above to get 16-Oct-2019 as the Accrual Start Date.

Step 2: Determine the Accrual End Date
Add tenor of 3M to the Accrual Start Date based on Modified Following Business Day convention. Accrual End Date is thus 16-Jan-2020

Step 3: Calculation of Adjusted RFR

\[ ARR_f = \frac{\text{DayCount}_{f,b}}{\text{DayCount}_{f,fr}} \times \frac{1}{\delta_{f,b}} \times \prod_{j=1}^{\text{MedPeriod}} \left( 1 + \delta_{b,b+1} \times FRF_{b+1} \right) - 1 \]

A = Determination of compounded rate, B = Annualizing factor, C = Day count adjustment between the IBOR and the RFR (USD LIBOR and SOFR in this case)

Step 4: Determine the Median Period Start Date and Median Period End Date
- Subtract tenor from Rate Record Day to get 16-July-2019
- Median Period End Date is two Business Days earlier, i.e. 12-July-2019
- Median Period Start Date is five years subtracted from the start date, i.e. 12-July-2014

Step 5: Determine the spread adjustment
The Spread Adjustment is the median spread between the IBOR (in this case, USD LIBOR) and the Adjusted RFR for the above period

Step 6: Calculating the All in Fallback rate
Fallback Rate = Adjusted RFR + Spread Adjustment

10 Please reference the Rule Book available on ISDA <GO> on Bloomberg Terminal and Bloomberg's LIBOR Transition website, as well as ISDA's Benchmark Reform and Transition from LIBOR page for the associated terminology.
### Appendix 2: Bloomberg Tickers

The Fallback Rate for an IBOR ticker can be found by adding ‘F’ before the relevant IBOR ticker (e.g., 3-month USD LIBOR has the ticker US00003M <Index> and the Fallback Rate for 3-month USD LIBOR has the ticker US00003M <Index>). Similarly, the Spread Adjustment for an IBOR ticker can be found by adding ‘S’ before the relevant ticker. For the Adjusted RFRs, the tickers usually follow the convention of adding the two-character ‘tenor’ identifier to the RFR name (e.g., the Adjusted RFR for 1-week compounded SOFR is SOFR1W <Index> and for the 3-month compounded SOFR tenor is SOFR3M <Index>). Note the exceptions in the table for SONIA and for TONA where the Adjusted RFR for JPY TIBOR. For the Overnight (O/N) or Spot Next (S/N) tenors, the ‘F’ is removed, and in the case of ESTR O/N the ester is ESTRONON <Index>.
